

How to setup custom business hours check in bots based on Day and time of the week?

Example use case : Business works 24\*7 but has different working hours for Weekdays and Weekends.

### Step 1

Have a private flow at the beginning of your botflow/the dialog where you would like to check the business hours

Create a property with property name as current-date-utc (Name only for reference) and property value as configured below

f(x) Add function

Function

Get Current Date

Format\*

HH:mm:ss-dd:MM:yyyy@EEE

Add Cancel

Here we have used HH:mm:ss-dd:MM:yyyy@EEE as the format specifically for our setup

In general, the "f(x) Get Current Date" will return the day and date, if the format is specified as below:

If you need just the date: dd-mm-yyyy: 30-09-2021

If you need date and day: dd-mm-yyyy@EEEE: 30-09-2021 @Thursday (you can use @,- or any special character of your choice)

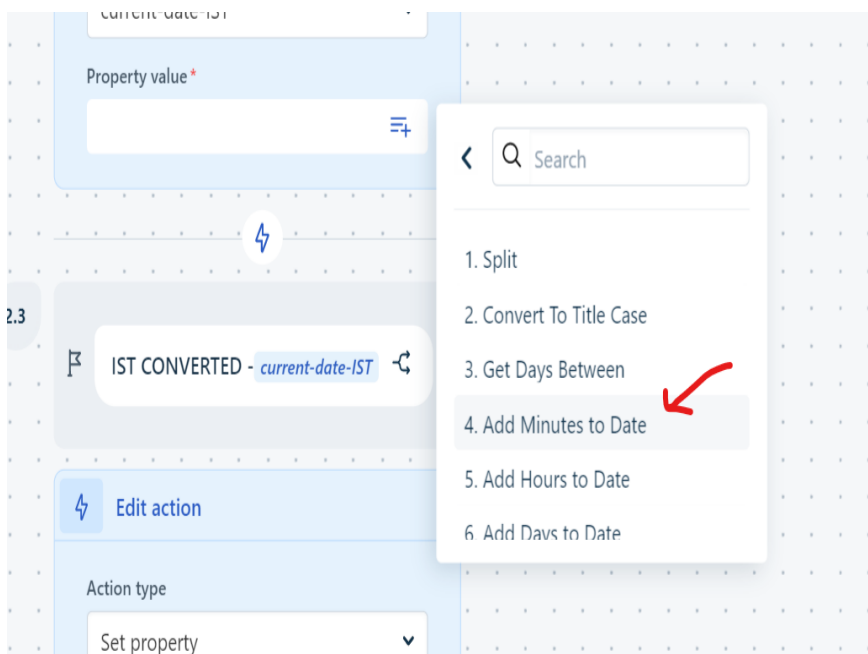

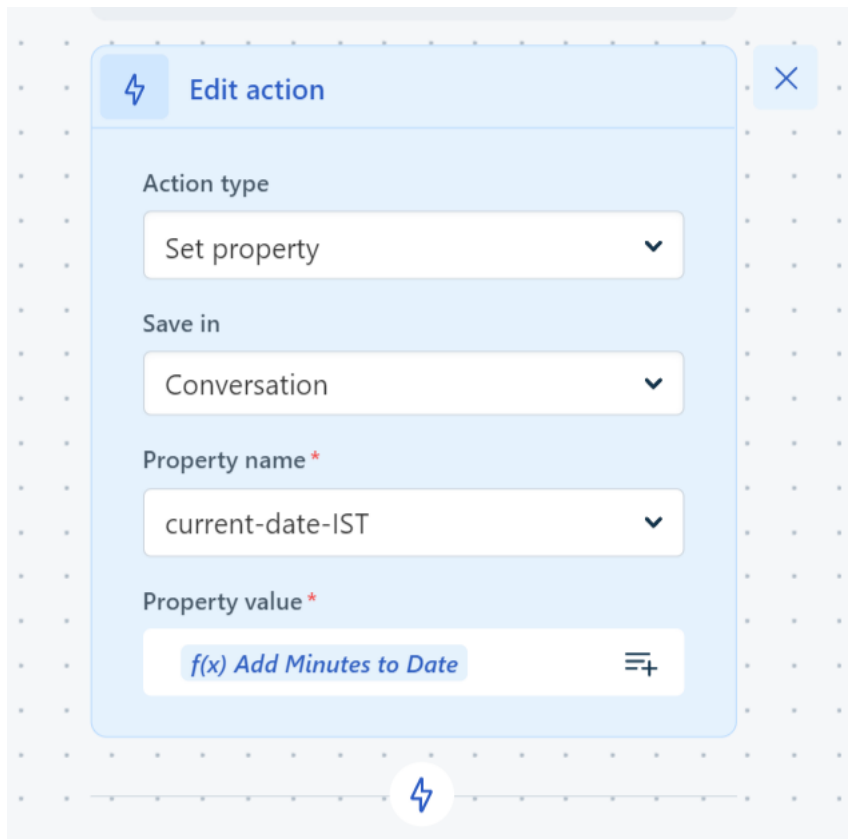

If you need just the day: EEE: Thu

If you need the time : HH:mm:ss

**Since the current date function will only fetch the date in UTC format, we have saved it in a separate property.**

## Step 2

Use another Set property action in the same dialog or the next dialog with Property name `current-date-IST` and property value as shown below

f(x) Add function

Function

Add Minutes to Date

Input Date\*

current-date-utc

Minutes\*

330

Format\*

HH:mm:ss-dd:MM:yyyy@EEE

Add

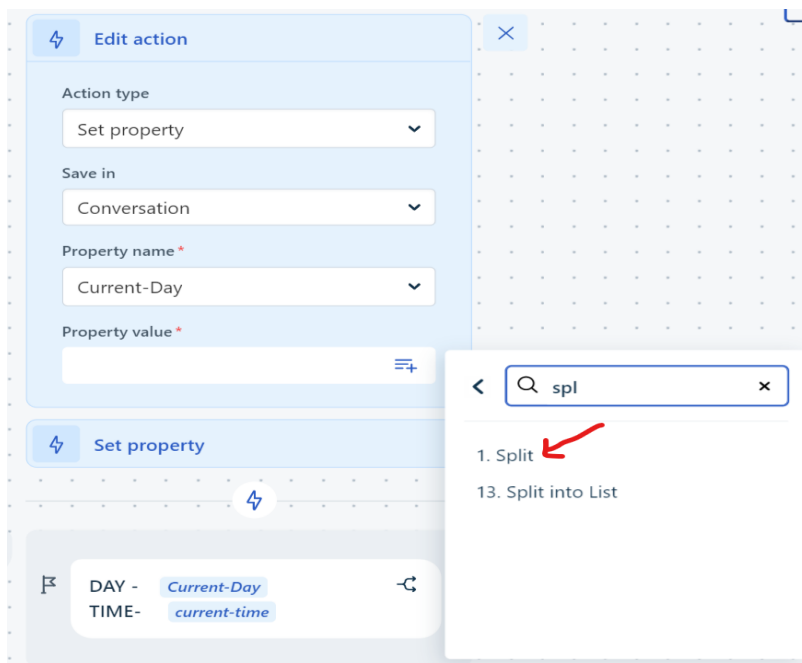

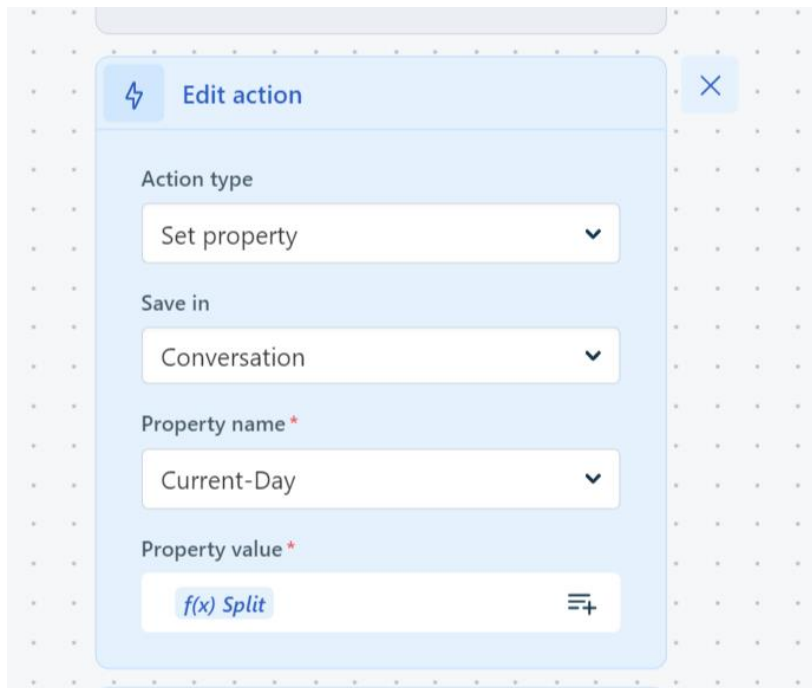

Cancel

Input date would be the previous property that we have stored.

Here, we are adding 330 minutes to the UTC time so that the time can be converted to IST. Based on your timezone, you can add the number of minutes to be added by checking the time difference between UTC and your required timezone

### Step 3

Now create a new property called Current-day as property name and property value as configured below

Here, the input text would be the property where you had converted the UTC date to your required timezone

Separator would be @ and index would 1 to get the day separately.

f(x) Add function

Function

Split

Input Text\*

current-date-IST

Separator\*

@

Index\*

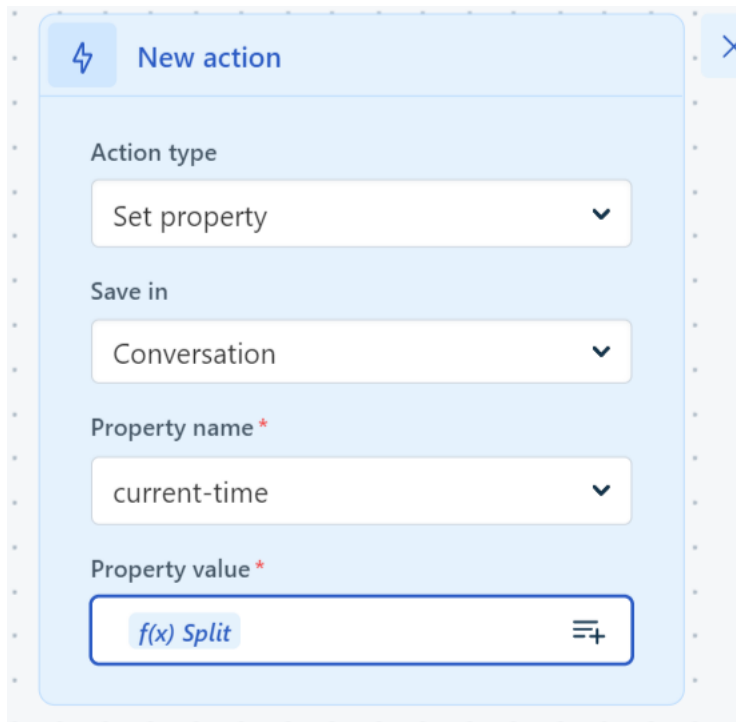

1

Add

Cancel

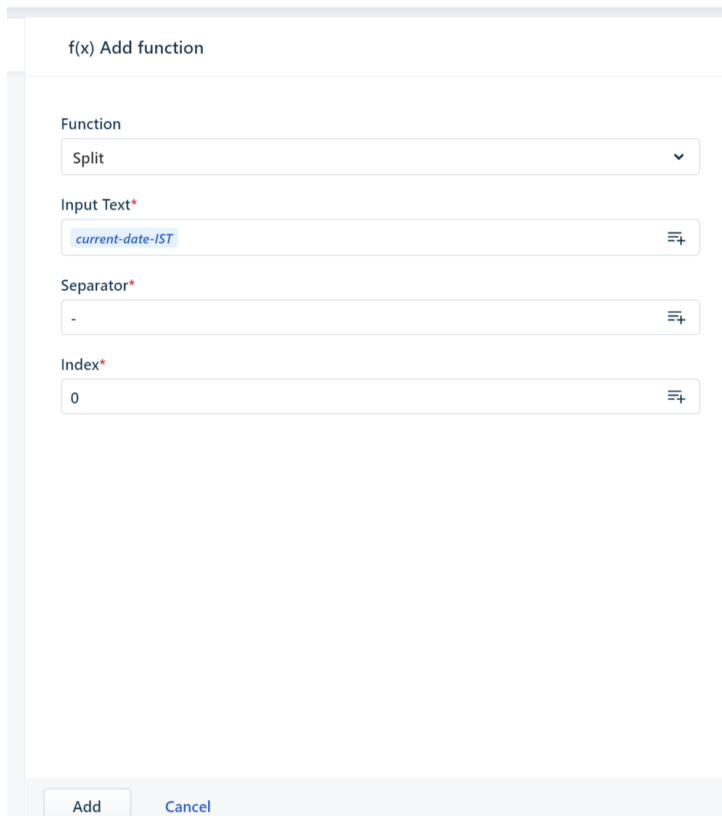

#### Step 4

Now create another property with property name as current-time and property value as configured below (sample split function as used above)

The 'New action' dialog box is shown with the following configuration:

- Action type:** Set property
- Save in:** Conversation
- Property name \*:** current-time
- Property value \*:** f(x) Split

The 'f(x) Add function' dialog box is shown with the following configuration:

- Function:** Split
- Input Text\*:** current-date-IST
- Separator\*:** -
- Index\*:** 0

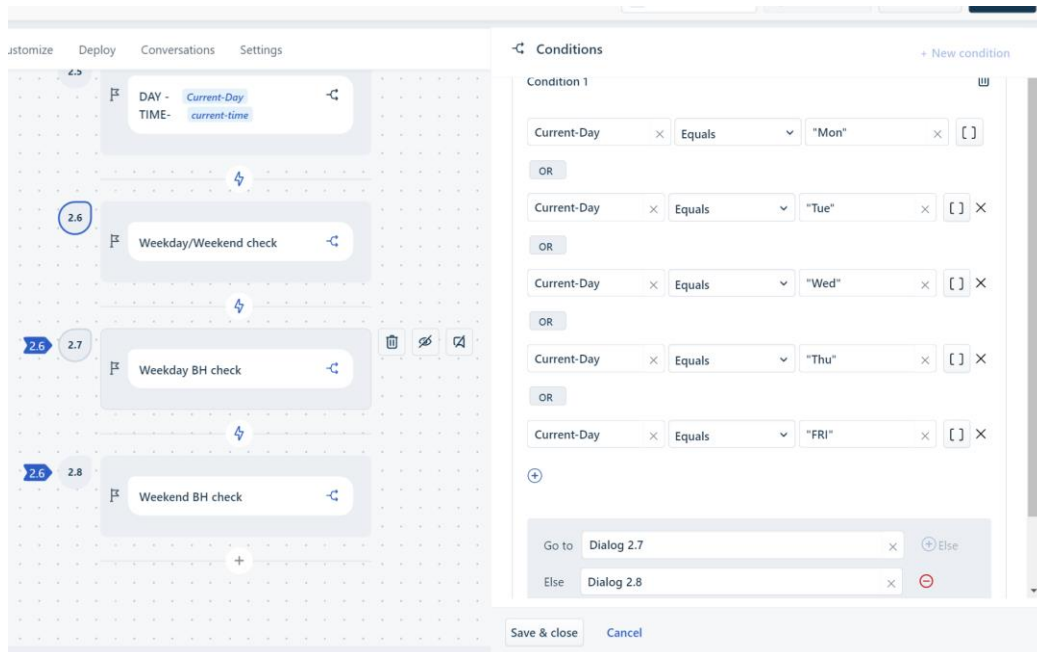

Buttons: Add, Cancel

## Step 5

Now, we have both current time and current day with us as separate properties.

We can use that in the next dialog to check the day and time

### Day of the week check :

### Time of the day check :
